From the ancients to the moderns, questions of economic theory and policy have been an important part of intellectual and public debate, engaging the attention of some of history's greatest minds. This book brings together readings from more than two thousand years of writings on economic subjects. Through these selections, the reader can see first-hand how the great minds of past grappled with some of the central social and economic issues of their times and, in the process, enhanced our understanding of how economic systems function. This collection of readings covers the major themes that have preoccupied economic thinkers throughout the ages, including price determination and the underpinnings of the market system, monetary theory and policy, international trade and finance, income distribution, and the appropriate role for government within the economic system. These ideas unfold, develop, and change course over time at the hands of scholars such as Aristotle, St. Thomas Aquinas, John Locke, François Quesnay, David Hume, Adam Smith, Thomas Robert Malthus, David Ricardo, John Stuart Mill, Karl Marx, William Stanley Jevons, Alfred Marshall, Irving Fisher, Thorstein Veblen, John Maynard Keynes, Milton Friedman, and Paul Samuelson. Each reading has been selected with a view to both enlightening the reader as to the major contributions of the author in question and to giving the reader a broad view of the development of economic thought and analysis over time. This book will be useful for students, scholars, and lay people with an interest in the history of economic thought and the history of ideas generally. According to author Bernstein, economic experts all too often manipulate and distort the science at the heart of important issues. In "Crunch," he offers entertaining, informative, and direct answers to a set of compelling economic questions posed by ordinary people. Twenty-four economists discuss how they promote egalitarianism, democracy and ecological sanity through research, activism, and policy engagement Economics and the Left presents interviews with twenty-four leading progressive economists. All of these practitioners of the "dismal science" are dedicated to both interpreting the world and changing it for the better. The result is a combustible brew of ideas and reflections on major historical events, including

the Covid-19 pandemic and its impact on the global economy. Interviewed are: Michael Ash, Nelson Henrique Barbosa Filho, James K. Boyce, Ha-Joon Chang, Jane D'Arista, Diane Elson, Gerald Epstein, Nancy Folbre, James K. Galbraith, Teresa Ghilarducci, Jayati Ghosh, Ilene Grabel, Costas Lapavistas, Zhongjin Li, William Milberg, Léonce Ndikumana, Ozlem Onaran, Robert Pollin, Malcolm Sawyer, Juliet Schor, Anwar Shaikh, William Spriggs, Fiona Tregenna and Thomas Weisskopf. This volume explores nine major questions regarding the labor market on which respected economists disagree. The purpose of the volume is to elevate the public debate about labor-market policy questions by exposing the public to this range of reasonable viewpoints. Economic concepts and techniques presented through a series of "big questions," models that show how to pose a questions rigorously and work toward an answer. This book helps readers master economic concepts and techniques by tackling fundamental economic and political questions through a series of models. It is organized around a sequence of "big questions," among them: When do markets help translate individuals' uncoordinated, selfish actions into outcomes that are best for all? Do markets change people, and, if so, for worse or better? Translated into the language of modern economics, do Marx's ideas have merit? Why is there so much income inequality? Or is there too little? The arguments are in the theorem-proof format, distinguishing results derived in the context of fully specified models from educated speculation. Readers will learn how to pose a question rigorously and how to work toward an answer, and to appreciate that even (especially!) the broadest and most ambitious questions call for a model. The goal of the book is not to indoctrinate but to show readers how to reason toward their own conclusions. The first chapter, on the Walrasian model of general equilibrium, serves as the prerequisite for the rest of the book. The remaining chapters cover less conventional topics, including the morality of markets; matching theory; Marxism, socialism, and the resilience of markets; a formalization of Kant's categorical imperative; unintended consequences of policy design; and theories of justice. The book can be used as a textbook for advanced undergraduate or graduate students or as a resource for researchers in disciplines that draw on normative economics. Based on a series of lectures presented at the University of Southern California in 1977 and 1978 as a part of the Department of Economics' colloquium "Contemporary economic issues."

Excerpt from *Essays and Addresses on Economic Questions (1865-1893): With Introductory Notes (1905)* The collection of *Essays and Addresses* contained in this volume may be described with sufficient accuracy as 'On Economic Questions,' for they treat of banking, currency, commercial crises, the distribution of trade-profits, the effects of joint-stock enterprise, of 'Laissez-faire' and Government interference, and cognate topics, all of which have interest for the economic student; but they were not composed from the point of view of a trained and scientific economist. To the latter title I have never been able to lay a claim. Throughout my treatment of this class of subject I have regarded them from the standpoint of a practical man of business, or of a public servant anxious to inquire into financial, economic, and social facts with a view to their bearing on matters of administration or legislation, rather than as an exponent of systems of Political Economy or as the adherent of any special school of thought. I have given more study to the examination and classification of facts than to the investigation of the more abstruse problems of political economy, and it has been on the analysis of complicated phenomena that I have bestowed most attention in my excursions into the domain of economics.

Providing a major new survey of the latest and most important new developments in applied econometrics, this volume focuses on key topics in macroeconomics. An essential guide for graduate students, academics and researchers. Water resource management is complicated in practice on account of the diverse nature of the resource and its many uses. This volume reports recent economic research on the theory, practice, and policy of water management. It is distinguished by the number and the range of the applications it considers. Chapters consider problems in the estimation of water demand in residential and agricultural contexts. Efficiency and externality considerations are considered in chapters concerning common aquifers as well as domestic conservation. Management policies are discussed in regard to chemical contamination, reservoir construction, and industrial regulation. The volume is intended for resource economists, especially those concerned with the management of water resources. It provides insights into the latest research on the economic issues concerning this important resource. With the economic problems facing Western economics during the last decade, theories about an alleged forty-five to sixty years' pulsation in economic life (the Kondratieff-Schumpeter cycle) have experienced a remarkable renaissance. Based on a new econometric test method, the author argues that long waves can be identified not only in price series but also in the aggregate output of a number of key industrialized countries. The author's own research corroborates Schumpeter's hypothesis that, far from being caused by a flash of genius, radical innovations occur in clusters, interacting with economic fluctuations and social change. This book addresses nine relevant questions: Will population growth reduce the growth rate of per capita income because it reduces the per capita availability of exhaustible resources? How about for renewable resources? Will population growth aggravate degradation of the natural environment? Does more rapid

growth reduce worker output and consumption? Do rapid growth and greater density lead to productivity gains through scale economies and thereby raise per capita income? Will rapid population growth reduce per capita levels of education and health? Will it increase inequality of income distribution? Is it an important source of labor problems and city population absorption? And, finally, do the economic effects of population growth justify government programs to reduce fertility that go beyond the provision of family planning services?
