market stalls, bus stops, telephone booths, toilets, advertising columns, ticket booths, mobile tents or housing units, emergency shelters, tourist information booths—this list of small, autonomously functioning buildings could be expanded almost infinitely. Small buildings shape our daily lives; they are found at the nearest street corner; they are present and indispensable, but as architecture they attract our attention only rarely. Yet these small structures occupy a definite place in the infrastructure of the city. Rather than focusing on the large attractions of architecture, architects find many potential ways to ensure the quality of everyday design hidden in these small, sometimes charming necessities. This volume in the *DETAIL* series spans the arc between architecture and product design, since not infrequently small buildings are located precisely in the area of tension between these two professions, and their successful realization is evident in the details of their construction. The feasibility and potential impact of so-called smart handguns has generated considerable public interest and debate. This report summarizes a June 2002 workshop at the National Academy of Engineering that examined three related issues: the state of technology for owner-authorized handguns; the role of product liability in the development and marketing of such firearms;

and the potential impact of these smart guns on health and crime. Smart-gun technology has the potential to prevent unintended or undesirable uses of handguns, such as accidental shootings; the shooting of police officers by assailants using the officers' own weapons; suicides; homicides with stolen handguns; and other gun-related crimes. However, information presented at the workshop suggests that considerably more research is needed to bring a reliable and commercially viable product to the marketplace. The report also notes that the impact of smart-guns will be influenced by legal issues, human behavior, economic conditions, and other factors.
