Editorial: Best Practice Approaches for Mixed Methods Research in Psychological Science Review of Recent Research on Organizational and Behavioral Factors Associated with Mine Safety Manual Handling Risk Assessment in Manufacturing Industries - a Focus on Women Work Practices Guide for Manual Lifting

"This booklet is written for managers and supervisors in industries that involve the manual handling of containers. It offers suggestions to improve the handling of rectangular, square, and cylindrical containers, sacks, and bags. "Improving Manual Material Handling in Your Workplace" lists the benefits of improving your work tasks. It also contains information on risk factors, types of ergonomic improvements, and effective training and sets out a four-step proactive action plan. The plan helps you identify problems, set priorities, make changes, and follow up. Sections 1 and 2 of "Improvement Options" provide ways to improve lifting, lowering, filling, emptying, or carrying tasks by changing work practices and/or the use of equipment. Guidelines for safer work practices are also included. Section 3 of "Improvement Options" provides ideas for using equipment instead of manually handling individual containers. Guidelines for safer equipment use are also included. For more help the "Resources" section contains additional information on administrative improvements, work assessment tools and comprehensive analysis methods. This section also includes an improvement evaluation tool and a list of professional and trade organizations related to material handling."--Page 6.

Assessment in natural contexts through observation is unquestionably complex. Systematic observation grounded in observational methodology offers a wide range of possibilities to the rigorous study of everyday behavior in their natural context. These possibilities have been enriched in recent decades with the explosion of

information and communication technologies. In this eBook we assemble 23 articles from several researchers who have made important contributions to this evolving field. The articles included in this eBook has been organized with a first part on general methodological developments and a second part with methodological contributions that emphasize different application areas. Considering the enormous possibilities of the systematic observation in the study of daily life, we hope this eBook will be useful to understand innovative applications in different fields. "This dissertation documents an evaluation of the incidence of overexertion or physical stress injuries, resulting from manually handling powered and non-powered hand tools and track materials, in railway Mobile Track Gangs. Consideration is given to the past and present roles of these gangs and the changes to modern mechanised equipment being imposed on them. Statistics on injuries by bodily location, and objects being handled at the time, are analysed. Tasks of these gangs are reviewed and manual handling activities are identified. Particular tasks that have resulted in an injury are also identified. A case study gang is observed and manual handling tasks are identified and assessed for risk of injury, using the Manual Handling Regulations and Code of Practice (Victoria, Department of Labour, 1988) format. A criteria of high, moderate and low risk is presented. Literature from Australia and overseas is reviewed for solutions to eliminate or reduce the risk. Effectiveness of control solutions is reviewed. A number of recommendations for further research are presented. " -- Abstract. Completely revised and updated, taking the scientific rigor to a whole new level, the second edition of the Occupational Ergonomics Handbook is now available in two volumes. This new organization demonstrates the enormous amount of advances that have occurred in the field since the publication of the first

edition. The second edition not only provides more information but makes it more accessible. Each volume narrows the focus while broadening the coverage, supplying immediate access to important information. One of the most comprehensive sources for ergonomic knowledge available, written by leading experts, providing both sound theory and practical examples, this book is a valuable resource for anyone in the field.

*Fundamental and Assessment Tools for Occupational Ergonomics* merges the frontiers of ergonomics, workplace design, and management issues. The editors have brought together researchers from disciplines such as biomechanics, anthropometry, and cognitive science with pioneering practitioners in industry. They discuss tools of the trade, upper extremity analysis, backs, interventions, management issues, design for ergonomics, principles of product design, band-aid approaches, processing, distribution centers, and service systems. The handbook is a compendium of information authored by top-flight investigators who represent the cutting edge of opinion, research, and interest in the field.

"Inherent in the nursing role are manual handling activities required for the provision of patient care. The physical demands upon nurses have resulted in high rates of musculoskeletal disorders (MSDs) within the profession. Despite the development of programs intended to reduce MSDs, sustainable solutions have remained elusive. Nurses continue to be disproportionately represented in the statistics for injuries arising from manual handling. Over 95% of nurses are likely to incur at least one MSD during their professional lifetime. The scholarly literature provides little evidence of the inclusion of nurses in the manual handling dialogue, despite their intimate knowledge of the healthcare environment. This thesis reports on a study of nurses speaking about their perspectives on current manual handling practices and their experiences of

participation in injury prevention programs. The research explored nurses' experiences of manual handling within acute and aged care health facilities in two Australian states, with the intent to make explicit the assumptions underlying contemporary approaches to manual handling issues. The overall aim of this research was to explore nurses' manual handling experiences in the specific context of healthcare organisations. An improved understanding of manual handling from the perspectives of nurses has the potential to explicate aspects of manual handling not previously considered in the development of programs to reduce injuries. The overarching intention of this study was to give nurses the opportunity to verbalise and examine their manual handling experiences and perceptions, with an aim to explore any possible transformative practices." --

Abstract. "A system for assessing manual handling skills in occupational health and safety training"--Publisher. This publication is aimed at employers and employees across all industries. It gives revised guidance on the Manual Handling Operations Regulations 1992. Every year workers' low-back, hand, and arm problems lead to time away from jobs and reduce the nation's economic productivity. The connection of these problems to workplace activities—from carrying boxes to lifting patients to pounding computer keyboards—is the subject of major disagreements among workers, employers, advocacy groups, and researchers. *Musculoskeletal Disorders and the Workplace* examines the scientific basis for connecting musculoskeletal disorders with the workplace, considering people, job tasks, and work environments. A multidisciplinary panel draws conclusions about the likelihood of causal links and the effectiveness of various intervention strategies. The panel also offers recommendations for what actions can be considered on the basis of current information and for closing information gaps. This book presents the

latest information on the prevalence, incidence, and costs of musculoskeletal disorders and identifies factors that influence injury reporting. It reviews the broad scope of evidence: epidemiological studies of physical and psychosocial variables, basic biology, biomechanics, and physical and behavioral responses to stress. Given the magnitude of the problem—approximately 1 million people miss some work each year—and the current trends in workplace practices, this volume will be a must for advocates for workplace health, policy makers, employers, employees, medical professionals, engineers, lawyers, and labor officials. The Bureau of Mines entered into a cooperative agreement with an eastern Kentucky coal mining company to comprehensively redesign the flow of equipment and supplies throughout its underground mines. Items were tracked from delivery to the warehouse and from surface storage areas to their final usage locations underground. Three underground mines were visited, and a great variety of tasks were videotaped for subsequent laboratory analysis. Of particular interest were tasks that required manual handling of the supplies or equipment components. Activities such as handling daily supplies (concrete blocks, rock dust, and cross-beams) and handling or lifting the continuous miner power cable were determined to be the most hazardous. Recommendations to the company included redesigned surface storage areas to facilitate the use of forklift vehicles to load the underground supply cars. Designs were also developed for different mechanical-assist devices to help in unloading the supply cars underground and to handle equipment maintenance tasks underground. Additionally, the videotapes of the underground manual handling tasks became the basis for simulating those activities in controlled laboratory conditions. This testing will contribute to developing guidelines for proper lifting techniques for low-seam coal mines. Manual handling is a

major cause of injury and ill health in the workplace. To implement the European Directive on the manual handling of loads (90/269/EEC), the Manual Handling Operations Regulations 1992 (MHOR) were introduced from 1 January 1993. A first evaluation study of the impact of the Regulations in 1996 found employers had accepted the need to control risks associated with manual handling and they found the ergonomic approach adopted by the Regulations to be an appropriate means of doing this. It is regularly reported that the construction industry has one of the highest levels of incidents of work-related injury in the UK. Research to date involving the management of health and safety in construction has concentrated on safety and in particular fatalities of construction workers. Yet the manual handling of heavy loads leading to occupational health problems is widespread in the industry. The aim of this research was to better understand the continued use of manual handling for the installation of concrete highway kerbs in the construction industry. The initial objectives were to review alternatives to and research on kerb handling; compare kerb handling methods; investigate the design process; and finally produce information for the supply chain. Due to time constraints on the project and the nature of the investigation an exploratory interpretive investigation was used to provide a flexible approach. A literature review led to research questions on training, risk of injury, designing for safety, organisation of the work and culture which narrowed the scope of the enquiry. The research used qualitative methods with observation of the work and a survey of key members of the supply chain through interviews and focus groups which provided rich data for analysis. The observation work, including postural analysis, has added to existing research mainly from other industries confirming the risk of injury of the manual handling operation and the reduced risks

through using alternatives. The survey collected a considerable amount of rich data from the supply chain members. This recorded their perceptions of the culture of other members and the change occurring with the introduction of new innovative technology. Results from the data analysis have been used to produce guidance material, including a process model, to support the industry with the management of highway kerb installation. Further research is required, collaborating with members of the supply chain, to validate the process model with practical applications. Data of the supply chain members perceptions can also be used for further examination of communication failings between members. Manual material handling accounts for more than 122,000 workplace injuries at U.S. One of the major reasons for injuries in the workplace is due to accidents caused by improper execution of the material handling fundamental moves. This may lead to serious musculoskeletal disorders. Research has been carried out to analyze the musculoskeletal disorders, but there are only very few related to manual material handling. This research proposes a methodology to analyze the quality of motion during lifting task performed in the manual material handling environment. The methodology consists of a motion capture environment, a system of sensors, a processor that collects time series data, and a data analysis module. Using motion capture cameras, data is collected on a variety of human subjects performing manual lifting task related to a material handling activity. The parameters for lifting experiment are obtained from the Snook's table. The collected data are analyzed through Dynamic Time Warping (DTW) technique which will compare the similarities between two motion sequences. At the end, the quality of the motion is analyzed through quality control charts which will provide the behavior of each motion. This research has potential impact for contribution in the manual material

handling industry. Using the latest developments in motion capture technology and data analytics, the analysis of the quality of motion will enable an industry to modify the human motion operations that are injurious to the operator and also help eliminate the non-value-added motions from the operations. Commonly used throughout the world, manual lifting tasks—whether simple or complex—all involve variable loads, postures, and movements. This practical guide discusses how to analyze the intricate lifting function and prevent injury during its execution. Outlining revised NIOSH Lifting Equation (RNLE) methods, the book illustrates their use in assessing manual lifting tasks of varying degrees of difficulty. Using examples to reinforce presented concepts, it explains how RNLE methods can be applied to evaluate single, composite, variable, and sequential lifting tasks. It also explores how to interpret and apply the results according to international standards and guidelines. Providing care and treatment for patients usually requires moving and handling activities associated with high rates of back injuries. The personal and financial cost of back pain and injuries to health staff means there is an urgent need to improve practice in this area. Over the past twenty years a number of guidelines have been published, however, these have been based on professional consensus rather than evidence. Evidence-Based Patient Handling tackles the challenge of producing an evidence base to support clinical practice and covers tasks, equipment and interventions. This book questions previously held opinions about moving and handling and provides the foundation for future practice. This report presents the outcome of an exercise carried out to establish scientifically-based principles for manual handling training, both for conventional (two-handed, symmetrical) lifting and for non-standard lifting, where the conventional technique is inapplicable Diploma

*Thesis from the year 2019 in the subject Engineering - Safety Engineering, , course: Occupational Safety, Health and Environmental Management, language: English, abstract: This study assessed the manual handling hazards at the NRZ mechanical workshop in Bulawayo. The objectives of the research were the identification of MH hazards, determine the level of awareness of workers on manual handling issues and assessment of the control measures put in place at the organisation to deal with manual handling issues. The researcher adopted a case study research design while incorporating both qualitative and quantitative approaches. Five workshops were only selected namely Wagon, Fitting, Machine, Foundry and Carriage resulting in a sample of 153 questionnaire respondents which were distributed in a randomly. Key informants who were interviewed was the SHE practitioner, nurse in charge, and workshop foremen. More data was also gathered from relevant secondary data sources as well as from field observations. The Statistical Package for Social Sciences (SPSS) was used to analyse data and specifically using the Chi-Square test to establish correlations. The result indicated that the majority of the respondents are not aware of manual handling as revealed by the 73% of the respondents who indicated that they are not aware of manual handling. A number of manual handling hazards were identified which comprise of awkward postures, repetitive movements and vibration exposure which result in a number of injuries which are known as musculoskeletal disorders which encompass cuts muscle strain, sprains chronic pain and minor injuries, The research also noted that the measures which are put in place by management in dealing with manual handling are not effective as they lack strategic action thereby limiting the success of the measures. It was finally concluded that there is need to consider ergonomic interventions in the day to day operations of the*

company in order to reduce work related risk factors and injuries which come as a result of manual handling. Recommendations were also forwarded to the nation and company on how to address manual handling issues. Commonly used throughout the world, manual lifting tasks—whether simple or complex—all involve variable loads, postures, and movements. This practical guide discusses how to analyze the intricate lifting function and prevent injury during its execution. Outlining revised NIOSH Lifting Equation (RNLE) methods, the book illustrates their use in assessing manual lifting tasks of varying degrees of difficulty. Using examples to reinforce presented concepts, it explains how RNLE methods can be applied to evaluate single, composite, variable, and sequential lifting tasks. It also explores how to interpret and apply the results according to international standards and guidelines. *Advances in Back Pain Research and Treatment: 2011 Edition* is a ScholarlyBrief™ that delivers timely, authoritative, comprehensive, and specialized information about Back Pain in a concise format. The editors have built *Advances in Back Pain Research and Treatment: 2011 Edition* on the vast information databases of ScholarlyNews.™ You can expect the information about Back Pain in this eBook to be deeper than what you can access anywhere else, as well as consistently reliable, authoritative, informed, and relevant. The content of *Advances in Back Pain Research and Treatment: 2011 Edition* has been produced by the world's leading scientists, engineers, analysts, research institutions, and companies. All of the content is from peer-reviewed sources, and all of it is written, assembled, and edited by the editors at ScholarlyEditions™ and available exclusively from us. You now have a source you can cite with authority, confidence, and credibility. More information is available at <http://www.ScholarlyEditions.com/>. This text presents an

accessible overview of manual handling law and the legal implications and practical issues involved. Topics covered include equipment provision and handling of children in schools and guidelines on health and safety. This book highlights the problems and hazards of manual materials handling and provides ergonomic and engineering solutions for alleviating them. It is helpful for both researchers and practitioners who are committed to solving the multifaceted manual materials handling problem. Recog: 1. Introduction - 2. The nature of work-related low back disorders - 3. Risk factors - 4. Strategies and effectiveness of prevention - 5. Risk assessment methods - 6. Future research topics - 7. Conclusions - 8. References - 9. Appendices.
