Michigan's Western U.P. Dec 21 2019 From an underground copper mine to a remote mountainside overlook, waterfalls, the Porcupine Mountains, and a host of other sites, this book explores the western side of Michigan's Upper Peninsula. Ralph G. Pifer, who has explored

the area for more than forty years, celebrates the beauty of the less explored, less known, and wilder part of the state—a place that was the home of famous residents such as Ernest Hemingway. Ancient mountain ranges, numerous lakes and rivers, museums, ghost towns, endless trails, and miles of Lake Superior's lakeshore make up this part of Michigan that tourists and area residents alike fail to fully appreciate. Once a thriving area with mines and logging, it is today a quiet backwater. Its history stretches back thousands of years, and it remains a place of great beauty, solitude, and wonderful people. Filled with photographs, site descriptions, maps, and helpful suggestions for travelers who want to avoid the beaten path, this book is an essential resource for anyone seeking to know more about this vibrant area.

A summary of each witch details their background, behaviour, strengths, weaknesses and, of course, powers. The result is 320 pages encased in a beautifully finished hardback cover, the ultimate field guide to designing witches that transcend time, place, and even the most vivid imagination.

From Research to Manuscript Apr 24 2020 Observations Plus Recipes It has been said that science is the orderly collection of facts about the natural world. Scientists, however, are wary of using the word 'fact.' 'Fact' has the feeling of absoluteness and universality, whereas scientific observations are neither absolute nor universal. For example, 'children have 20 deciduous [baby] teeth' is an observation about the real world, but scientists would not call it a fact. Some children have fewer deciduous teeth, and some have more. Even those children who have exactly 20 deciduous teeth use the full set during only a part of their childhood. When they are babies and toddlers,

children have less than 20 visible teeth, and as they grow older, children begin to lose their deciduous teeth, which are then replaced by permanent teeth. 'Children have 20 deciduous [baby] teeth' is not even a complete scientific statement. For one thing, the statement 'children have 20 deciduous teeth' does not tell us what we mean by 'teeth.' When we say "teeth," do we mean only those that can be seen with the unaided eye, or do we also include the hidden, unerupted teeth? An observation such as 'children have 20 deciduous teeth' is not a fact, and, by itself, it is not acceptable as a scientific statement until its terms are explained: scientifically, 'children have 20 deciduous teeth' must be accompanied by definitions and qualifiers.
